2012-10-17-i386 FATAL: Module fuse not found. [7740.325018] nvidia.ko: nvidia, RAMDISK_WARN(+0x1a3e8) btw2, is this supposed to happen, the box is booted into windows intel pro 1000 is attached to the nic, ubuntu 12.04.2 LTS modprobe fuse how do you know that didnt work ali1234 lsm od it might not be in there fuse is the file system im not using any file system i think its because i dont have a network cable and im using wifi sounds like you might have a kernel bug the message is not "specific" to fuse do you know of any others google led me to this page Launchpad bug 956067 in nvidia-graphics-drivers (Ubuntu) "kernel panic when trying to use nvidia drivers" [Undecided,Confirmed] i think i have that it's a known problem with nvidia drivers. it also sounds like you have an intel wifi card should i try the older version no, i'm not familiar with the message you are getting from the website i pasted you need to post the full message it's really really long ok you said it said "nvidia.ko: nvidia, RAMDISK_WARN(+0x1a3e8) what is that error supposed to mean? when i run lsm od lsm od doesnt 82157476af
